OAuth Launchpad

APM Integrations take-home submission

Candidate: Sudhanshu Tiwari | sudhanshutiwari264@gmail.com

Live demo:

The problem

Connecting an app or agent to a provider (GitHub, Slack, Google, or something more obscure) usually starts with registering an OAuth app, and it's rarely clear upfront whether that's a 10-minute form or a two-week approval wait. OAuth Launchpad turns scattered developer docs into a sourced, shareable, step-by-step guide - built live for any app, not just a fixed library.

How it works

A FastAPI backend runs a real research pipeline per app: search for official OAuth docs (Tavily), fetch the actual pages, extract structured requirements with an LLM (TarqaAI) instructed to answer only from the provided excerpts, then validate and assemble a guide where every claim is attached to a source and every real gap is surfaced as an 'open question' instead of guessed. Progress streams to the Next.js frontend live - no simulated loading, no hardcoded guides.

Demonstrated

- Three pre-seeded guides with different setup profiles: GitHub (low effort, no approval), Slack (medium, approval only for Marketplace listing), Google (high, conditional verification).
- Live generation tested end-to-end in production against an app outside the library (Figma) - completed in under 3 minutes with 5 sourced steps, scopes, and blockers.
- Checked generated guidance against its own cited sources: caught a real extraction bug where a third-party source's own callback URL was mis-attributed to the provider, fixed the prompt, and proved the fix against the live model with a regression test.

Key decisions and limitations

Full architecture, the complete decision log, and known limitations (shared checklist state with no auth, SQLite at this scale, no per-scope review detail, no live registration testing) are documented in the repository README, along with setup instructions and screenshots.

Everything above is reproducible from the repository - nothing in this submission requires paid accounts or credentials.
